To Our Valued Weed & Feed Customer:

Greetings from Alex Irrigation & Landscaping as we welcome the spring of 2026! As soon as weather allows, we will be out to start our 1st application of Crabgrass Preventer/Fertilizer.

To guarantee placement on our Weed & Feed schedule for the 1st application, please take a moment to fill out the enclosed form and **return top (white) copy to us no later than April 1st**. This contract will allow us to schedule your lawn service for optimum results. As a rule of thumb, the 1st application should be applied by the end of May or before the lilacs bloom.

Those of you who chose to have the crabgrass preventer applied for the 3rd application can still do so by simply putting "C/F" next to your selection for application #3. **Please note that sales tax is not included in this contract price and will be applied at the time of billing.**

Aeration:

All aeration will be done in the fall - normally this service is completed after all of our 4th applications are done. As previously offered, should you decide to purchase all four applications, we would offer a 50% discount on aeration.

As Alex Irrigation & Landscaping proudly begins its 39th season, I personally want to thank you for your continued business and support! As a reminder, we can meet all your Irrigation & Landscaping needs - please do not hesitate to contact the office for a free estimate for any size project you may have!

Sincerely,
Steve Svec, Owner
Alex Irrigation & Landscaping, Inc.

*****The estimated price is based on the square footage of your lawn in our records. Should the actual square footage vary from our records, you will be notified of any price change prior to application.**

Please remit by mail to: Alex Irrigation & Landscaping

| Spring | Early
Summer | Mid-Late
Summer | Fall | Fall Aeration
Only |
| (mid-April
to late May) | (late May to
end of June) | (July to late
August) | (September
to early Oct.) | |

Your cost per application: \$ 612²⁴

Brief information about applications:

- 1 - Crabgrass Pre-Emergent, Fertilizer and Broadleaf control should be applied in early spring for adequate weed control.
- 2 - Broadleaf control and Fertilizer should be applied in early summer, as this application is to rid of dandelions.
- 3 - Broadleaf control and fertilizer should also be applied in late summer.
- 4 - Fertilizer and Weed control should be applied in the fall. This application allows slow release feeding through the winter for an early spring green up.
- 5 - Aeration: Soil compaction is a frequent cause of turf deterioration caused by lawn traffic such as walking and mowing. Soil compaction can have an adverse effect on the health of the turf. Aeration relieves the soil by removing evenly-spaced cores of turf up to 3" in depth. Once the soil is aerated, air exchange is improved and the soil can easily absorb water. Aeration also promotes deeper root growth for a lawn that is lush, healthy and drought resistant.

Please check desired applications, sign and return one copy to our office. Again, thank you for your cooperation.
